

Quick-Change Pallet Chuck: CNC workholder offers Speed and Flexibility

Tooling Technology, LLC offers a Quick-Change Pallet Chuck for CNC milling. This member of the Segen quick change family is designed to keep the CNC cutting. This innovative pallet system improves both existing and new machining centers by palletizing everyday tasks. Mount machine stock, workholders, or dedicated fixtures to pallets, creating a repeatable home position for your CNC work station.

Save costly machine time by preparing stock on the bench. Mill one job while another is being prepared. Reduce part costs and cycle times by eliminating needless steps. Once palletized, long runs or emergency jobs are always ready to run. Move work from machine to machine while maintaining the same home position. Palletized stock allows clamp-free cutting. Pallets instantly lock with 23,000 lbs of mechanical holding force and stay locked until standard air pressure is reapplied. Segen's Quick-Change Pallet Chuck is ideal for job shops, mold making, and production manufacturing. The Quick-Change Pallet Chuck gives you the speed to compete and the flexibility to adapt.
